

Individual Reflection & Recommendation to BER+

IDI S26 — BER+ Board Room Project

Yushu Qin

XU University of Applied Sciences

26 June 2026

Part 1 — Personal Reflection

What was your role in the project?

My contribution centred on **stakeholder experience and narrative coherence** across the BER+ Board Room prototype. Together with Tian Shao and Yi Li, I helped translate a strategic corridor challenge into something an audience could *use* in under five minutes: a welcome flow that frames the Board Room in business language (English and German), persona-based entry paths for companies, investors, and municipalities, and a guided walkthrough that drives the real map instead of blocking it with lecture slides.

Concretely, I worked on mobile usability (bottom navigation, explore sheets, tour dock stacking), ensuring the demo remained credible on phones during the live BER+ presentation, and on messaging that stresses our core story: **the corridor narrative is data-driven and aims at more transparency** — evidence on one map, labelled sources, shared visibility before site visits and contracts. I also supported Playwright-based screenshot capture so our final deliverables document the same paths stakeholders would follow in production.

What were your key learnings?

Three learnings stand out.

First, innovation in ecosystems is as much about legitimacy as about technology. BER+ cannot “own” cadastral truth or planning authority. The prototype’s value is hosting a *neutral* briefing surface where members retain data ownership and indicative OSM layers are clearly labelled. That constraint forced us to design for transparency and humility rather than for feature completeness.

Second, stakeholder engagement improves when the interface mirrors how people already search. Companies look for land; investors scan who is active in the corridor; municipalities need programme context and infrastructure layers. Persona tabs and the guided tour encode those mental models. When the map moves during the walkthrough, sceptical audiences shift from “pretty slide” to “I could use this in a board session.”

Third, real-world projects reward testable artefacts. Automated UX screenshots (Playwright) gave us regression confidence before the June presentation and now support the course final submission. Building for demonstrability — live URL, mobile layout, skip/replay tour — was as important as any algorithmic matching rule.

What worked well?

The **problem-first framing** resonated: fragmented PDFs and invisible availability are pains every BER+ stakeholder recognises before we show a single feature. The **live demo URL** (<https://ber-board-room.vercel.app/>) let the room follow on their own devices. **Bilingual explainer copy** (EN/DE) helped German members and international investors in the same session. The **guided tour as live demo** — company → investor → municipality → evolution — matched how Prof. Halecker described the course objective: exploration and impulses, not a finished strategy.

What would you do differently?

I would start **member validation interviews** two weeks earlier — with Arcadis, WFG, or SEGRO — to tag which OSM links are “member-confirmed” versus “indicative only.” I would also reduce initial scope on AI chat (Ollama dependency) in favour of a clearer **Inquiry Ledger** mock-up, because matching follow-through matters more to BER+ operations than conversational UI. Finally, I would document data refresh ownership (who pays for quarterly OSM snapshots) in the UI itself, not only in briefing slides.

Insights on innovation, ecosystems, strategy, and stakeholders

Innovation here is incremental and institutional: a map probe that lowers the cost of coordination. **Ecosystem** theory became practical — airport, developers, utilities, and public bodies will not merge CRMs; they need a host (BER+) with no competitive land position. **Strategy development** in the course was explicitly non-final: we offered option paths (visibility → matching → verified inventory) rather than a single roadmap. **Stakeholder engagement** succeeded when we let each persona “win” in the first two minutes of their path (land for companies, Mitglieder density for investors, OSM intel for municipalities).

Part 2 — Recommendation to BER+ Management

Which strategic direction would you recommend pursuing?

I recommend BER+ **adopt the Board Room as a hosted briefing platform** for the Flughafenregion corridor — not as a product sale, but as an association capability. Strategic direction: *data-driven transparency first, matching second, verified asset registry third*. Phase I should anchor on Pilot-1 (SEGRO / Schönefeld Nord) with quarterly OSM refresh and 3–5 member–asset links validated in workshops.

Which ideas should be explored further?

- **Neutral Board Room sessions** — quarterly leadership briefings where decisions are recorded against programme milestones on the map.
- **Verified link pilot** — explicit member confirmation workflow for OSM highlights and land anchors (visible “verified” badge in UI).
- **Inquiry Ledger operations** — operationalise “Save” on the matching map into a lightweight introduction queue BER+ staff can chair.
- **Benchmark teleport** — continue peer region comparisons (Schiphol, Flanders) in investor packs; strengthens the “regional story” without claiming cadastral accuracy.
- **Mobile-first access** — many site visits start on phones; maintain the bottom-nav + explore sheet pattern for field briefings.

Which ideas should be deprioritized or discarded?

- **Replacing planning authority or cadastral GIS** — outside BER+ mandate; keep layers indicative.
- **Single-member branded portals** inside the association map — undermines neutrality.
- **Publishing unverified asset claims** as if authoritative — reputational risk; use draft/verified states only.
- **Heavy AI assistant** before basic data governance — invest in refresh cadence and member validation first.
- **“Finished platform” narrative** — the course prototype is a probe; overselling would damage trust built in April–June 2026.

Suggested next step for BER+

Within 90 days: (1) board resolution to **host** the Board Room URL under BER+ branding with a simple MOU on data liability; (2) nominate **three pilot Mitglieder** for verified map links; (3) schedule one **recorded briefing** where leadership marks a Pilot-1 decision on the shared map. That step is small enough to execute, measurable enough to grade success, and faithful to what our prototype already demonstrates live.
